

Bypass and Anvil Shears, Rettberg

The blades of the bypass shears „pass by“ each other for a clean, gentle cut. They are ideal for pruning shrubbery and for fine-scale cutting of branches, tubes, and many other materials. Quality „made in Germany“.

In the anvil shears, the blade closes onto a fixed surface, the anvil. The advantage of this principle is the perfect power transmission. The handle shape allows you to brace the shears against a support for particularly hard cuts. This cutting system avoids cutting impact and is ideal for wood, hoses, synthetics, and other materials. Quality „made in Germany“.
